ABSTRACT

This check list provides a method for observing and recording the development of children aged 1 to 6 and handicapped children in six categories of skills: gross motor development, fine motor development, social, self help, cognitive, and language. The scoring system is designed to provide information on the rate of development in each category; this is calculated as the developmental age--the percentage of the normal rate of development achieved, divided by the chronological age. The resulting data are useful for evaluating the students and the effectiveness of the intervention program, planning curriculum objectives, and selecting appropriate instructional materials and methods. INTRODUCTION

The Learning Accomplishment Profile (LAP) is designed to provide the teacher of the young handicapped child with a simple criterion - referenced record of the child's existing skills. Use of the LAP enables the teacher to: identify developmentally appropriate learning objectives for each individual child; measure progress through changes in rate of development; and provide specific information relevant to pupil learning.

LAP - Section I - Developmental Data

A hierarchy of developmentally appropriate behaviors, drawn from the most recent normative data, provides the basis of an evaluation of the child's existing skills in six areas of development: Gross Motor, Fine Motor, Social, Self Help, Cognitive, and Language.

LAP - Section II

The task-level hierarchy provides: guidance in sequencing skill development and an efficient system of recording responses on a specific task.

LAP - Section III

Forty-four weeks of Curriculum Units with isolated concepts presented in a hierarchy of responses enable the teacher to record specific behaviors demonstrated by the child within units of learning.

The LAP provides the teacher or paraprofessional with a comprehensive profile of the handicapped child's developmental accomplishments. Knowledge of individual competencies encourages prescriptive methods of:

- (1) Determining level of response capabilities in each area of development
- (2) Identifying specific beharioral objectives
- (3) Utilizing effective instructional materials and methodology
- (4) Evaluating teacher and pupil progress

LAP - I

DEVELOPMENTAL EVALUATION

An awareness of the sequential development of the primitive steps which are pre-requisites to later skills enables the teacher of the handicapped child to avoid the global leaps which can produce failure. An evaluation which focuses on the identification of developmentally appropriate skills is a meaningful departure from the typical "testing" situation which offers little more than a statistical. comparison of the handicapped child with a normal population.

The artificiality of the "testing" experience is diminished when the child's own teacher becomes the evaluator. By capitalizing on the familiar environment of the classroom, the teacher is encouraged to design evaluative experiences which reflect normal components of the developmental program. For instance, in determining the child's ability to "spread butter with a knife", the teacher might plan a toast-making experience for snack-time and observe the child's ability to perform the task in the natural setting.

Evaluation of observable skills enables the teacher to determine appropriate learning objectives for each child.

MEASURING PUPIL CHANGE

Awareness of the child's developmental age in the pre-intervention assessment enables the teacher to measure progress through change in <u>rate</u> of development.

To determine the child's rate of development, divide the developmental age by the chronological age.

(DA = percentage of normal rate of development). For instance, if a four-year-old child has a developmental (CA age of two in fine motor skills, his rate of development is 50% of normal rate of learning. (24/48 = 50%).

Periodic graphing of the developmental age enables the teacher to compare changes in rate of development.

If, after ten months in the intervention program, the child has progressed twelve months, he has increased his rate of development. (36/58 = 62%). The change in percentage of rate of normal development represents an increase from 50% to 62%. This type of measurement makes no attempt to explain the cause of increase or to predict a maintenance of the current rate, but it can indicate changes in the <u>rate</u> of pupil development after participation in the intervention program.

TASK-LEVEL PROFILE

A comprehensive collection of task-level objectives which reflect the developmental program are broken down into sequential steps of learning. The check-list hierarchy of responses within each task provides the teacher with a guide to sequencing the learning program and an efficient system of recording individual pupil progress.
